

Problems with RNN

Dr. Muhammad Safyan

Problem with RNN

- Suitable for sequential data
 - Text , Time series
- Not used too much
 - Suffer with 2 major problems
 - Problem of long term dependency
 - Unstable gradient.
- Start to forget with the time step.
 - Next word prediction.
 - Punjabi is spoken in Punjab. Lahore is beautiful city. But I could not enjoy because I don't understand Punjabi.
 - Vanishing Gradient Descent

Unstable Training

- **Stagnant Training:**
- Exploding Gradient problem
- Longer term having so much large number , dominate the short term and become finite.
- e.g. relu +ve term derivative.
- Learning rate is not proper
 - Gradient Clipping
 - Control learning rate
 - LSTM

- RNN unfold input times
- Its length depends upon values in time steps(100 time steps)
- In Back propagation your tried to minimize the loss.
- Its done with Gradient Descent formula
- W_i, wh, wo

$$\frac{\partial L}{\partial w_{in}} = \left[\begin{array}{cccc} \frac{\partial L}{\partial \hat{y}} & \frac{\partial \hat{y}}{\partial o_3} & \frac{\partial o_3}{\partial w_{in}} \\ \frac{\partial L}{\partial \hat{y}} & \frac{\partial \hat{y}}{\partial o_3} & \frac{\partial o_3}{\partial w_{in}} \end{array} \right] + \left[\begin{array}{cccc} \frac{\partial L}{\partial \hat{y}} & \frac{\partial \hat{y}}{\partial o_3} & \frac{\partial o_3}{\partial o_2} & \frac{\partial o_2}{\partial w_{in}} \\ \frac{\partial L}{\partial \hat{y}} & \frac{\partial \hat{y}}{\partial o_3} & \frac{\partial o_3}{\partial o_2} & \frac{\partial o_2}{\partial w_{in}} \end{array} \right] + \left[\begin{array}{ccccc} \frac{\partial L}{\partial \hat{y}} & \frac{\partial \hat{y}}{\partial o_3} & \frac{\partial o_3}{\partial o_2} & \frac{\partial o_2}{\partial o_1} & \frac{\partial o_1}{\partial w_{in}} \\ \frac{\partial L}{\partial \hat{y}} & \frac{\partial \hat{y}}{\partial o_3} & \frac{\partial o_3}{\partial o_2} & \frac{\partial o_2}{\partial o_1} & \frac{\partial o_1}{\partial w_{in}} \end{array} \right]$$

Long Term Dependency Problem

- In long sequence, Gradient Descent of short term Dependency contribute more then long term dependency.

$$\frac{\partial L}{\partial \hat{y}} \frac{\partial \hat{y}}{\partial o_{100}} \frac{\partial o_{100}}{\partial o_{99}} \dots \dots \frac{\partial o_2}{\partial o_1} \frac{\partial o_1}{\partial w_{in}}$$

How to reduce this problem

- Proper Activation function
 - Relu, Leaky Relu
- Better weight Initiation
- Skip gram
- LSTM
