Advanced Topic In Deep Learning

Dr. Muhammad Safyan

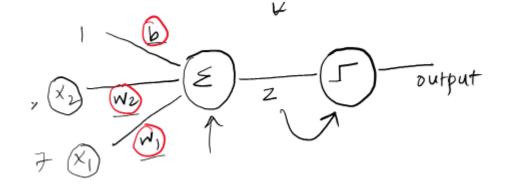

Logistic Regression

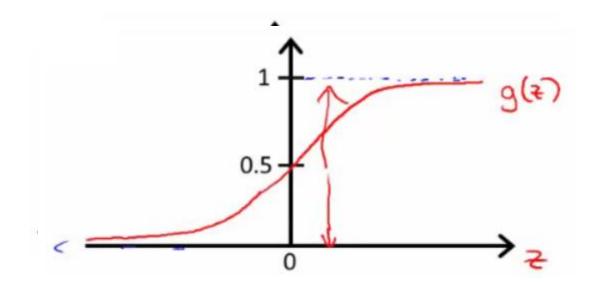

- **Classification** Where y is a discrete value
 - Develop the logistic regression algorithm to determine what class a new input should fall into
- Classification problems
 - Email -> spam/not spam?
 - Online transactions -> fraudulent?
 - Tumor -> Malignant/benign

Logistic Regression

$$h_{\theta}(x) = \frac{1}{1 + e^{-\theta^T x}}$$

 $Z = W_1 \times_1 + W_2 \times_2 + b$

Cost Function-Logistic Regression

$$Cost(h_{\theta}(x), y) = \begin{cases} -\log(h_{\theta}(x)) & \text{if } y = 1\\ -\log(1 - h_{\theta}(x)) & \text{if } y = 0 \end{cases}$$

$$J(\theta) = -\frac{1}{m} \left[\sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)})) \right]$$

GD-Backpropgation

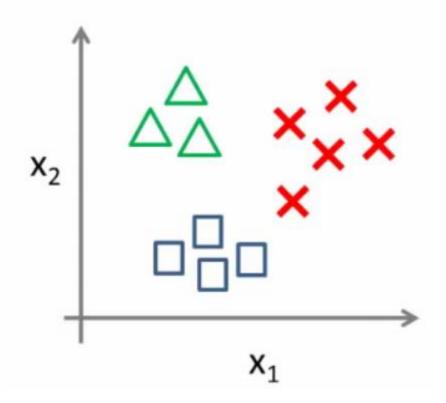

Repeat
$$\{\, \theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta) \,\}$$

Multiclass classification

One vs. all classification

SoftMax

Multi-class classification:

Hypothesis/cost/prediction

$$P(y=k\mid x) = rac{e^{z_k}}{\sum_{j=1}^K e^{z_j}}$$

$$z = Wx + b$$

Where:

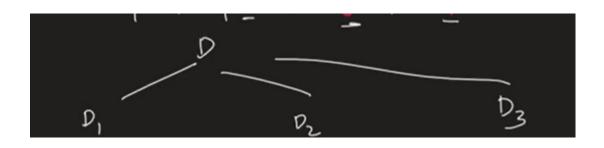

ullet $z=[z_1,z_2,...,z_K]$ are the logits for each of the K classes

Then, apply the **softmax function** to convert logits into class probabilities:

$$\hat{y} = rg \max_{k} P(y = k \mid x)$$

Training-Multiclassificatin

One-Hot Encoding

Multiple Models to be trained Increased Parameters Increased computation Time

Loss Function-Multi-classification

$$L = -rac{1}{m}\sum_{i=1}^{m}\sum_{k=1}^{K}y_k^{(i)}\log\left(\hat{y}_k^{(i)}
ight)$$

$$\underbrace{y_1^{(1)}\log(\hat{y}_1^{(1)}) + y_2^{(1)}\log(\hat{y}_2^{(1)}) + y_3^{(1)}\log(\hat{y}_3^{(1)})}_{}$$

$$+ \underbrace{y_1^{(2)} \log(\hat{y}_1^{(2)}) + y_2^{(2)} \log(\hat{y}_2^{(2)}) + y_3^{(2)} \log(\hat{y}_3^{(2)})}_{} + \underbrace{y_1^{(2)} \log(\hat{y}_1^{(2)}) + y_2^{(2)} \log(\hat{y}_3^{(2)})}_{}$$

$$L = y_1^{(1)} \log(\hat{y}_1^{(1)}) + y_2^{(2)} \log(\hat{y}_2^{(2)}) + y_3^{(3)} \log(\hat{y}_3^{(3)})$$

$$+ \underbrace{y_1^{(3)} \log(\hat{y}_1^{(3)}) + y_2^{(3)} \log(\hat{y}_2^{(3)}) + y_3^{(3)} \log(\hat{y}_3^{(3)})}_{}$$

• Now we have to calculate:

$$\hat{Y}_{1}^{(1)} = \sigma - (W_{1}^{(1)} X_{11} + W_{2}^{(1)} X_{12} + W_{0}^{(1)})$$

$$Y_{2}^{(2)} = \sigma - (W_{1}^{(2)} X_{21} + W_{2}^{(2)} X_{22} + W_{0}^{(2)})$$

$$Y_{3}^{(3)} = \sigma - (W_{1}^{(3)} X_{31} + W_{2}^{(3)} X_{32} + W_{0}^{(3)})$$

$$\mathbf{W} = egin{bmatrix} w_1^{(1)} & w_2^{(1)} & w_0^{(1)} \ w_1^{(2)} & w_2^{(2)} & w_0^{(2)} \ w_1^{(3)} & w_2^{(3)} & w_0^{(3)} \end{bmatrix}$$

09- weights to be updated

$$egin{align} w_1^{(i)} &= w_1^{(i)} - \eta rac{\partial L}{\partial w_1^{(i)}} \ & \ w_2^{(i)} &= w_2^{(i)} - \eta rac{\partial L}{\partial w_2^{(i)}} \ & \ \end{array}$$

Derivative Chain Rule:

$$rac{\partial \mathcal{L}}{\partial w_k} = rac{\partial \mathcal{L}}{\partial z_k} \cdot rac{\partial z_k}{\partial w_k}$$
 :

09- weights to be updated

$$egin{align} w_1^{(i)} &= w_1^{(i)} - \eta rac{\partial L}{\partial w_1^{(i)}} \ & \ w_2^{(i)} &= w_2^{(i)} - \eta rac{\partial L}{\partial w_2^{(i)}} \ & \ \end{array}$$

Derivative Chain Rule:

$$rac{\partial \mathcal{L}}{\partial w_k} = rac{\partial \mathcal{L}}{\partial z_k} \cdot rac{\partial z_k}{\partial w_k}$$

$$y_k^{(i)} \log \left(\hat{y}_k^{(i)}
ight)$$

• Derivative chain rule

$$rac{\partial \mathcal{L}}{\partial w_k} = rac{\partial \mathcal{L}}{\partial z_k} \cdot rac{\partial z_k}{\partial w_k}$$
 .

$$rac{\partial \mathcal{L}}{\partial z_k} = \sum_{j=1}^K rac{\partial \mathcal{L}}{\partial \hat{y}_j} \cdot rac{\partial \hat{y}_j}{\partial z_k}$$

$$rac{\partial \mathcal{L}}{\partial \hat{y}_j} = -rac{y_j}{\hat{y}_j}$$

$$\mathcal{L} = -\sum_{j=1}^K y_j \log(\hat{y}_j)$$

$$rac{\partial \mathcal{L}}{\partial z_k} = \sum_{i=1}^K rac{\partial \mathcal{L}}{\partial \hat{y}_j} \cdot rac{\partial \hat{y}_j}{\partial z_k}$$

$$rac{\partial \hat{y}_j}{\partial z_k} = egin{cases} \hat{y}_k (1 - \hat{y}_k) & ext{if } j = k \ -\hat{y}_j \hat{y}_k & ext{if } j
eq k \end{cases}$$

$$\hat{y}_j = rac{e^{z_j}}{\sum_{l=1}^K e^{z_l}}$$

Step 3: Apply Chain Rule

Now combine both:

$$rac{\partial \mathcal{L}}{\partial z_k} = \sum_{j=1}^K \left(-rac{y_j}{\hat{y}_j}
ight) \cdot rac{\partial \hat{y}_j}{\partial z_k}$$

Now we split the sum into two cases:

Case 1: When j=k

$$ext{Term} = -rac{y_k}{\hat{y}_k}\cdot\hat{y}_k(1-\hat{y}_k) = -y_k(1-\hat{y}_k)$$

Case 2: When $j \neq k$

$$ext{Term} = -rac{y_j}{\hat{y}_j} \cdot (-\hat{y}_j \hat{y}_k) = y_j \hat{y}_k$$

$$rac{\partial \mathcal{L}}{\partial z_k} = -y_k (1 - \hat{y}_k) + \sum_{j
eq k} y_j \hat{y}_k$$

Now factor out \hat{y}_k :

$$rac{\partial \mathcal{L}}{\partial z_k} = -y_k + y_k \hat{y}_k + \hat{y}_k \sum_{j
eq k} y_j$$

But in one-hot encoding:

- Only one $y_j=1$, the rest are 0
- ullet So $\sum_{j
 eq k} y_j = 1$ if $y_k = 0$, otherwise 0

Thus, in all cases:

$$rac{\partial \mathcal{L}}{\partial z_k} = \hat{y}_k - y_k$$

Here your two cases are:

- Case 1 ($y_k=1$): $rac{\partial \mathcal{L}}{\partial z_k}=-1+\hat{y}_k$.
- Case 2 ($y_k=0$): $rac{\partial \mathcal{L}}{\partial z_k}=\hat{y}_k$.

So set $A=-1+\hat{y}_k$ and $B=\hat{y}_k$:

$$rac{\partial \mathcal{L}}{\partial z_k} = \left(-1 + \hat{y}_k
ight) y_k + \hat{y}_k (1 - y_k).$$

2) Simplify

$$egin{aligned} \left(-1+\hat{y}_k
ight)y_k+\hat{y}_k(1-y_k) &= -y_k+\hat{y}_ky_k+\hat{y}_k-\hat{y}_ky_k \ &= \hat{y}_k-y_k. \end{aligned}$$

Final Result:

$$rac{\partial \mathcal{L}}{\partial z_k} = \hat{y}_k - y_k$$

Simplification of $\frac{\partial z_k}{\partial w_k}$

$$z_k = w_k^\top x$$

$$rac{\partial z_k}{\partial w_k} = x$$

Then, by chain rule:

$$rac{\partial \mathcal{L}}{\partial w_k} = rac{\partial \mathcal{L}}{\partial z_k} \cdot rac{\partial z_k}{\partial w_k} = (\hat{y}_k - y_k) \cdot x$$

Final Formula:

$$rac{\partial \mathcal{L}}{\partial w_k} = (\hat{y}_k - y_k) \cdot x$$
